                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated uropathogenic E. coli nucleotide sequences - used to develop products for the detection of pathogenic E. coli and to develop products for the detection of pathogenic E. coli and to a licit an immune response to pathogenic E. coli E. coli and inmune response to pathogenic E. coli chi sequence represents a E. coli strain J96 contig containing this sequence represents a E. coli strain J96 contig containing of this sequence represents. The sequences, and represents a nucleic acid pathogenicity island (PAI) sequences of the invention are taken from pathogenicity determinants. The sequences of the invention are taken from PAI IV and PAI V. PAI IV is located at approximately 64 min (near pheV) con the E. coli chromosome and is approximately 94 min (at pheR) on the E. coli chromosome and is approximately 160 kb in size. Antibodies specific to the proteins encoded by the PAI open reading frames of the invention can be used in kits to detect uropathogenic E. coli. The proteins are used in vaccines to elicit a protective immune response in an animal to the uropathogenic E. coli catrain J96.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

New bacterial plasmid contg. heat sensitive replication system -
new bacterial plasmid contg. heat sensitive replication, used to
and marker gene opt. capable of chromosomal integration, used to
an activate specific gene or introduce heterologous gene
brample 2: Fig 9; 73pp; French
contained pGK12 (Appl.Environ.Microbiol., 48: 726 (1984)) contg. two
containing pGK12 (Appl.Environ.Microbiol., 48: 726 (1984)) contg. two
containing pGK12 (Appl.Environ.Microbiol., 48: 726 (1984)) contg. two
containing RepA - see Q48466 and Q48467), cut with Clar and Hparl and
the 3340bp fragment lacking the Car resistance gene was ligated to a
45bp Pvull fragment lacking the Car resistance gene was ligated to a
45bp Pvull fragment of pBluescript SK+ containing a multicloning
containing plasmid was designated pVE6004 (or pG+host4 - Q48463). It
contained at 28 deg.C.

No. 1solated human steroidogenesis acute regulatory protein gene - used isolated human steroidogenesis acute to detection of mutation(s) of this gene that cause congenital ripoid adrenal hyperplasia.

Claim 1; Pages 23-25; B9Pp; English.

The present sequence encodes the human steroidogenesis acute regulatory protein (hStAR). The hStAR gene can be analysed for regulatory protein (hStAR). The hStAR gene can be analysed for mutations to detect (e.g. prematally) genetic defects associated with congenital lipoid adrenal hyperplasia (CAH), or its transmission to children. CAH can be treated by protein or gene replacement therapy, which can also be used to prevent or treat hypercholesterolaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   21-MX-1997 (first entry)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gruss A, Maguin E;

MPI; 93-303478/38.

New bacterial plasmid contg. heat sensitive replication system -

New bacterial plasmid contg. heat sensitive replication system -

New bacterial plasmid contg. heat sensitive replication system -

The and marker gene, opt. capable of chromosomal integration, used to

Inactivate specific gene or introduce heterologous gene

Szemple 2; Frg 10, 73pp; French.

Plasmid pGK12 (Appl. Environ.Microbiol., 48; 726 (1984)) contg. two

Rample 2; Frg 10, 73pp; French.

Plasmid pGK12 (Appl. Environ.Microbiol., 48; 726 (1984)) contg. two

Antiblocit realstance marker genes was subjected to mutagenesis with

Ndroxylamine. A heat-stable mutant was isolated (coding for a heat-

sensitive RepA - see Q48466 and Q48467), cut with Clai and Hparl and

A45bp Pvull fragment lacking the Cm resistance gene was ligated to a

445bp Pvull fragment of pBluescript SK+ containing a multicloning

site, 77 and 73 promoters and sequencing primer blinding sites. The

resulting plasmid was designated pycB6004 (or pG-host4 - Q48463).

To facilitate cloning in E.coli, the 1.4kb Aval-AlwNI fragment of

pRRR322 (containing the origin of replication) was inserted into

Ramin-clasved pG+host4 to give pG+host5 (Q48464). The pBR322 ORI

allows maintenance of the plasmid in E.coli at 37 deg.C. while the

hat-sensitive ORI allows maintenance at 28 deg.C in gram-positive
                                                                                                                                                                                                                                                                                                                                                                                        4147 TAGTGGATCCCCCGGGCTGCAGGAATTCGATATCAAGCTTATCGATACCGTCGACCTCGA 4206

Temperature sensitive replication; antibiotic resistance marker gensite specific recombination; chromosomal integration; inactivation; heterologous gene expression; thermosensitive plasmid; ds.
A human adrenal cortex cDNA library was screened with a mouse StAR probe to isolate a 1.6 kb insert, including an ORF for a 285 residue protein. When it was cloned into pSPORT and expressed in COS-1 calls octransfected with pP450scc abd pADX, it increased the lavel of pregnenolone synthesis from cholesterol or 20-alpha-hydroxycholesterol.

This is the nucleotide sequence of London-FAD APP targetting
This is the nucleotide sequence of London-FAD APP targetting
the part-2453. The intendention provides a novel gene targetting
strategy that facilitates the introduction of one or more specific
mutations into any gene in a single double reciprocal homologous
crecombination step. The method has been used particularly for
introducing a humanised amyloid precursor protein (APP) gene into
codents for producing animal models of Alzheimer's disease (AD).
Crodents for producing animal models of Alzheimer's disease (AD).
Crodents for producing animal models of Alzheimer's disease (AD).
Crodents for producing animal models of Alzheimer's disease (AD).
Crodents for producing animal models of Alzheimer's disease (AD).
Crodents for producing animal models of Alzheimer's disease (AD).
Crodents for producing animal models of Alzheimer's disease (AD).
Crodents for producing animal models of Alzheimer hybrid (m/APP) where
amino acid residues (66-77) of APP770 were encoded by human cDNA
crodents instead of mouse genomic exons 16-18). Within
these residues, only a maino acid differences exist between the
mouse and human proteins, i.e. dly-676 to Arg, Phe-681 to Thr and
croated using vector pMII-2433, the London mutation. i.e.
Created using vector pMII-2433, the London mutation. i.e.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Graease the nucleotide sequence of Swedish-FAD APP targetting This is the nucleotide sequence of Swedish-FAD APP targetting This is the nucleotide sequence of Swedish-FAD APP targetting convector part-2398. The introduction of one or more specific strategy that facilitates the introduction of one or more specific compliantion step. The method has been used particularly for introducting a humanised amyloid precursor protein (APP) gene into introducing a humanised amyloid practicularly for codents for producing animal models of Alzheimer's disease (AD).

Crodents for producing animal models of Alzheimer's disease (AD).

Crodents for producing animal models of Alzheimer's disease (AD).

ESS401 and ESS403) have been created using the gene targetting technique applied to embryonic stem cells. In each line, the mouse APP gene was modified to encode a mouse/human hybrid (m/AAPP) where amino acid residues 666-770 of APP770 were encoded by human cDNA.

Created containing a humanised beta-amyloid domain. In line ESS007, created using vector pWrI-238, the Exwedish mutation. i.e. containing a humanised amyloused. The targetted Swedish in the containing a humanised and introduced. The targetted Swedish in the containing a humanised and introduced. The targetted Swedish in the containing a humanised and introduced. The targetted Swedish intervention and containing a humanised and containin

This is the nucleotide sequence of Swedish/London-FAD APP targetting vector puri-254. The invention provides a novel gene targetting strategy that facilitates the introduction of one or more specific mutations into any gene in a single double reciprocal homologous crecombination step. The method has been used particularly for introducing a humanised anyloid precursor potein (APP) gene into codents for producing animal models of Alzheimer's disease (AD).

Introducing a humanised anyloid precursor protein (APP) gene into codents for producing animal models of Alzheimer's disease (AD).

Ending a papel of transgenic mice (inter ESS103), ESS103, ESS10

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 10,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 121, Application US/08967101
Fatent No. 5840340
GENERAL INFORMATION:
APPLICANT: ST. GEORGE-HYSLOP, PETER H
APPLICANT: FRASER, PAUL E
TILLE OF INVENTION: GENETIC SEQUENCES AND PROTEINS RELATED
TITLE OF INVENTION: GENETIC SEQUENCES AND PROTEINS RELATED
TITLE OF INVENTION: TO ALZHEIMER'S DISEASE
NUMBER OF SEQUENCES: 183
CORRESPONDENCE ADDRESS:
ADDRESSEE: TESTA HURMITZ & THIBEAULT
STREET: High Street Tower - 125 High Street
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Length 793;

/clone_lib="Bloodstream form of white an iched mRNA
/clone_nonate from different developmental stages of T.b.Drucei
prepared from different developmental stages of T.b.Drucei
by reverse transcription followed by PCR amplification
using mini-exon and oligo(dT) primers. The CDNA generated
were utilized in RADES-PCR coupled with differential
hybridisations to identify differentially expressed mRNA
transcripts. The products which showed to.be
differentially expressed were cloned pGEM -T vector.
These differentially expressed mRNA transcripts were (are
being) sequenced to generate differentially expressed
sequence tags."

## ALIGNMENTS

ö Chandley AC, Cooke HJ, Hargreave TB, Kun M, Sharkey AM;
WPI: 95-17021/22.
WRITHING A mode gequence and encoded polypeptide - may be used in the clinical diagnosis of male infertility.
Disclosure: Fig 5: 40pp; English.
A mouse gene partial sequence (087664) showing homology to the human azoospermia factor (AZF) YRMM gene was obtd. from mouse genomic phage clone M3.2 isolated from a genomic library screened with MYK (YRRMI) clone M3.2 isolated from a genomic library screened with MYK (YRRMI) of the mouse Y-chromosome. A full cDNA sequence (Q87665) was also obtd. 43 GCCATGAGTGGATCCCCCGGGCTGCAGGAATTCGATATCAAGCTTATCGATACCGTCGAC 102 Gaps /*tag= a

PT Pass calling of residual fluorescence labelled nucleotide analogues - to prevent migration in electrophoretic sequencing gel and interference with base calling of DNA chains PS Example; Fig 1; 18pp; English.

Example, Fig 1; 18pp; English.

Example Fig 1; 18pp; English.

C The invention concerns the modification in electrophoretic labelled nt analogues to prevent migration in electrophoretic concerns the modification in or prevent with base calling of DNA chains. The modification involves the use of a phosphatase enzyme to remove at modification involves the use of a phosphatase enzyme to remove at cleast one 5'-phosphate pp. The nts were prepared using ABI Amplitted dye-terminating kt. The template used was I microg. of MI3 mp8. The primer was MI3 Universal primer. Samples were recovered. Some were primer was MI3 Universal primer. Samples were digestion. This collines TO4865, TO4867 was a control nt. which was not treated with includes TO4866. TO4887 was a control nt. which was not treated with calkaline phosphatase. The example shows that alkaline phosphatase.

C treatment causes removal of the dye-terminator artefacts and allows for accurate base calling with the ABI analysis software.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Figure 1. Cm; wp1; 99-081273/07.

New isolated Treponema pallidum nucleic acids - used to develop new isolated Treponema pallidum nucleic scharacterisation, prevention products for the detection, diagnosis, characterisation, prevention and therapy of T. pallidum infections, particularly syphilis Claim 1; Page 257; 1150pp; English.

X00500-21243 represent polynuclectide sequences from the genome of Treponema pallidum. The sequences can be used for detection, diagnosis, characterisation, prevention and therapy for T. pallidum infections, particularly syphilis. They can also be used for detecting diseases related to Borrelia infections in animals, and for the production of blosynthetic products such as enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   28-JAN-1996 (first entry)
Nucleotide analogue treated with calf intestinal alkaline phosphatase.

Claim 10; Page 30-31; 74pp; English.

Cand 11-22 (T75003-10) were obtd. by screening human genomic libraries using human breast tumour-associated retroviral element libraries using human breast tumour-associated retroviral element.

B18Ag1 (see also T75002) as probe. These non-contiguous sequences in entrovirus genome (see also T75001). B18Ag1 and the other retrovirus sequences can be used in genetic vaccines and for the prognosis, diagnosis and monitoring of human breast cancer.

Sequence 1122 BP; 260 A; 316 C; 185 G; 279 T;

                                                                                                                                                                                                                                                       Endogenous human tumour-associated retroviral element, B18Ag1 - used for the prognosis, diagnosis and monitoring of human cancers, especially breast cancer claim 10; Page 31-32; 74pp; English.

Human endogenous retroviral sequences 10, 11-29, 3, 6, 12, 13, 14 and 11-22 (775003-10) were obtd. by screening human genomic libraries using human breast tumour-associated retroviral element B18Ag1 (see also 775002) as probe. These non-contiguous sequences lie in order 11-22, 14, B18Ag-1, 13, 12, 10, 3, 11-29, 6 in the retrovirus genome (see also 775001). B18Ag1 and the other retrovirus sequences can be used in genetic vaccines and for the prognosis, diagnosis and monitoring of human breast cancer. Sequence 1091 BP; 79 A; 350 C; 97 G; 248 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0; Gaps

for detection of mutation(s) of this gene that cause congenital

Ilpoid adrenal hyperplasia

Claim 1: Pages 23-25: 89pp; English.

Crap present sequence encodes the human steroidogenesis acute

regulatory protein (hStAR). The hStAR gene can be analysed for

mutations to detect (e.g. prenatally) genetic defects associated

Crap congenital 11poid adrenally hyperplasia (CAH), or its

transmission to children. CAH can be treated by protein or gene

Craplacement therapy, which can also be used to prevent or treat

Nepercholesterolaemia.

A human adrenal cortex CDNA library was screened with a mouse StAR

Creplace protein. When it was cloned into pSpoRT and expressed in

COS-1 cells cotransfected with pP450scc abd pADX, it increased the

Example 2; Fig 10; 73pp; French.

Plasmid pGKL2 (Appl. BDviron. Microbiol., 48; 726 (1984)) contg. two antiblotic resistance marker genes was subjected to mutagenesis with hydroxylamine. A heat-stable mutent was isolated (coding for a heat-sensitive RepA - see Q48466 and Q48467), cut with ClaI and HpaII and sensitive RepA - see Q4860 and Q48467), cut with ClaI and HpaII and 445bp PvuII fragment lacking the Cm resistance gene was ligated to a 445bp PvuII fragment of pBluescript SK+ containing a multicloning

New bacterial plasmid contg. heat sensitive replication system -
mearker gene opt. capable of chromosomal integration, used to
and marker gene opt. capable of chromosomal integration, used to
an inactivate specific gene or introduce heterologous gene
Disclosure; Fig 11; 73pp; French.

Disclosure; Fig 11; 73pp; French.

Plasmid pGK12 (Appl.Environ.Microbiol., 48; 726 (1984)) contg. two
antiblotic resistance marker genes was subjected to mutagenesis with
dydroxylamine. A heat-stable mutant was isolated (coding for a heat-
sensitive RepA - see Q48466 and Q48467), cut with Clal and Hparl and
sensitive RepA - see Q48466 and Q48467), cut with Clal and Hparl and
the 3340bp fragment lacking the Cm resistance gene was ligated to a
445bp Pvull fragment of pBluescript St+ containing a multicloning
site, T7 and T3 promoters and sequencing primer binding sites. The
resulting plasmid was designated pVE604 (or p6+host4 - Q8463).

To facilitate cloning in E.coll, the Ava-'EcoRI fragment of pBR322
containing the origin of replication and the ampicillin resistance
peh-host6 (Q48466). The pBR322 ORI allows maintenance of the plasmid in
E.coll at 37 deg.C. while the heat-sensitive ORI allows maintenance
of the pram-positive bacteria.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 4984 AGTGGATCCCCCGGGCTGCAGGAATTCGATATCAAGCTTATCGATACCGTCGACCTCGAG 4925

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           plasmid pG+host6 containing Is replication system.
Temperature sensitive replication; antibiotic resistance marker gene; site-specific recombination; chromosomal integration; inactivation; heterologous gene expression; thermosensitive plasmid; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         49 AGIGGAICCCCCGGGCIGCAGGAAIICGAIAICAAGCIIAICGAIACCGICGACCICGAG 108
site, T7 and T3 promoters and sequencing primer binding sites. The resulting plasmid was designated pVE6004 (or pG+host4 - Q48463). To facilitate cloning in E.coli, the 1.4kb AvaI-AlwNI fragment of pBR322 (containing the origin of replication) was inserted into NsiI-cleaved pG+host4 to give pG+host5 (Q48464).The pBR322 ORI allows maintenance of the plasmid in E.coli at 37 deg.C. while the heat-sensitive ORI allows maintenance at 28 deg.C in gram-positive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1980 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim 14; Fig 1A-H; 37pp; English.

This is the nucleotide sequence of a clone of the fluory2 (fl2)

This is the nucleotide sequence of a clone of the fluory2 (fl2)

gene of maize. It codes for a 24-kDa alpha-zein protein (see W2397) that includes a 21-maino acid signal peptide (see W23976)

which targets the alpha-zein to the lumen of the rough endoplasmic reticulum. A claimed cereal plant contains a transgene comprising a first polynucleotide that encodes the fl2 signal peptide and a second polynucleotide that encodes an agronomically high-value treaff, and a transgene that also includes the fl2 promoter. The second polynucleotide preferably encodes a protein that has a high contained of Met, Lys, Try and/or Thr so that feeds from transformed maize, wheat, rice, barley, millet or sorghum will have increased contents of these essential amino acids in their seeds (all
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             49 AGTGGATCCCCCGGGCTGCAGGAATTCGATATCAAGCTTATCGATACCGTCGACCTCGAG 108

This is the nucleotide sequence of Swedish-FAD APP targetting

control of the facilitates the introduction of one or more specific

strategy that facilitates the introduction of one or more specific

mutations into any gene in a single double reciprocal homologous

contentions into any gene in a single double reciprocal homologous

recombination step. The method has been used particularly for

introducing a humanised amyloid precursor protein (APP) gene into

condents for producing animal models of Alzheimer's disease (AD).

Condents for producing animal models of Alzheimer's disease (AD).

Condents for producing animal models of Alzheimer's disease (AD).

Condents for producing animal models of Alzheimer's disease (AD).

Condents for producing animal models of Alzheimer's disease (AD).

Condents for producing animal models of Alzheimer targetting

condents applied to embryonic stem cells. In each line, the mouse

condents applied to encode a mouse/human hybrid (m/hAPP) where

condents diseased of APP gene was modified to encode a mouse/human cDNA

condents for producing animal expand of APP770 were encoded by human cDNA

condents for producing animal expand of APP770 were encoded by human cDNA

condents for producing animal encoded a mouse (exons 16-18).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                49 AGTGGATCCCCCGGGCTGCAGGAATTCGATATCAAGCTTATCGATACCGTCGACCTCGAG 108

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             WPI; 99-181029/15.
P-PSDB; W97997, W97998.
Modification of target nucleic acids - by homologous recombination, used particularly for introducing a humanised amyloid precursor protein gene into rodents for producing models of Alzheimer's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             sequences instead of mouse genomic exons (exons 16-18). Within these residues, only 3 amino acid differences exist between the mouse and human proteins, i.e. Gly-676 to Arg, Phe-681 to Thr and Arg-684 to His. The exon-cDNA fusion gene therefore encodes an APP containing a humanised beta-amyloid domain. In line ES5007, created using vector pMTI-2398, the Swedish mutation. i.e. KM(670,681)NL, was also introduced. The targetted Swedish-FAD m/hAPP gene expressed m/hAPP protein at levels approaching those observed for mouse APP in brain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

Example; Page 14-12.3 'UVPPP; ENGISEA, CONDON-FAD APP targetting vector pwr1-2454. The invention provides a novel gene targetting vector pwr1-2454. The invention provides a novel gene targetting vector pwr1-2454. The invention provides a novel gene targetting vector pwr1-2454. The invention provides a novel gene targetting vector protein a single double reciprocal homologous recombination step. The method has been used particularly for introducing a humanised amyloid precursor protein (APP) gene into introducing animal models of Alzheimer's disease (AD). Independent lines of transgenic mice (lines ES5007, ES5103, and ES5403) have been created using the gene targetting technique applied to embryonic stem cells. In each line, the mouse technique applied to embryonic stem cells. In each line, the mouse applied to encode a mouse/human hybrid (m/hAPP) where sequences instead of mouse genomic exons (exons 16-18). Within these residues, only 3 amino acid differences exist between the conse and human proteins, i.e. Gly-676 to Arg, Phe-681 to Thr and Arg-684 to His. The exon-cDNA fusion gene therefore encodes an APP containing a humanised beta-amyloid domain. In line ES5103, created using vector phr1-2454, the London mutation. In line ES5103, introduced. The targetted Swedish/London ThatPP gene expressed introduced. The targetted Swedish/London FAND m/hAPP gene expressed introduced.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            P-PSDB; W97998, W98000.
Modification of target nucleic acids - by homologous recombination, used particularly for introducing a humanised amyloid precursor protein gene into rodents for producing models of Alzheimer's
